Custom Stuffing Equipment

As the pioneers in this industry, we have developed many different systems available for the "stuff it yourself" stuffed animal business.

Our systems range from individual components to fully integrated self-contained systems.

Component Systems

Individual components consist of:

- Stuffing machines
- Fluffing machines
- Compressors
- Our unique Charm/Display Dispenser
- Accessory equipment

The component systems have been typically utilized in larger floor plan locations where there is room for and desire to spread out the activity.

Integrated systems are typically used in smaller footprint locations or kiosks and consist of just about any combination of the above systems.

S3 Modular Stuffer

The most popular set up is a combination of two Stuffing machines, one Fluffing machine, a Charm Display / Dispenser and interactive lighting system that makes the stuffing appear to change color.

Integrated Systems

The integrated system can be supplied with one of three air-supply configurations:

- A fully integrated compressed air system
- An air power unit system
- No compressed air system at all (requiring an external air supply)

FS2N-SN Integrated Stuffer

All three systems have their pros and con's. The fully integrated compressed air system is the most expensive arrangement but provides the performance one is use to from a compressed air system. The air power unit system is less expensive and performs very well but takes slightly longer to fill a product. The system with no compressed air is the least expensive and is typically used in larger floor plan locations where multiple machines are supplied with compressed air from a single compressor (usually installed in a mechanical room somewhere). In addition, we have integrated other

systems and devices such as interactive sound(s) and sound systems, display panels, scrolling LED message boards and others.

We customize our basic machine to each client's needs and desires, in order to deliver a product that is unique, specific, and recognizable to the clients brand. We do have 'generic' systems that we sell to the manufacturing industry. These 'generic' systems are typically of the individual component style.

We also provide and can develop custom software for the creation of 'Birth Certificates', 'Story Books', and other things along with software to run the "business end" of your operation including bar code scanning, inventory control and point of sale.

We also supply the polyester fiber that is used to stuff the animals. We do not supply the plush.

Pricing

In regards to pricing, it is best if we understand what your application is going to be.

To give you an idea of the cost:

- A Single Component stuffing machine (Model S3) is in the \$9,000 - \$10,000 range.
- A Fluffing machine is about \$7,000 - \$9,000 depending on how many stuffing machines it needs to supply.
- Compressor systems can range from \$5,000 - \$15,000 depending on the number of Stuffing machines and the type and features of the compressor.
- A "stand-alone" Charm Display / Dispenser is about \$5,000.
- A basic integrated system (Model FS2N), as described above, starts at about \$24,000 and goes up from there depending on how it is equipped.
- A basic integrated system (Model FS2N) for an industrial application (without charm dispenser, decorative lighting, etc.) starts at \$17,500.

FS2N Integrated Stuffer
